

## Script for Terrestrial Vegetation Animation

<b>Action</b>	<b>Voice Over</b>
Music/soundscape	Plants that depend on groundwater need it close to the Earth's surface so their roots can access the water.
Animation starts	Winter rains raise groundwater levels, allowing plants easy access to it.
Animation moves to summer water levels	In dry summers, many plants depend on groundwater as their main water source.
Fluctuation between winter and summer water levels	Terrestrial vegetation often relies on groundwater to survive.
Well appears	Intensive groundwater pumping lowers groundwater levels.
Groundwater level lowering	Some plants lose access to groundwater when the levels drop below their root zones.
Groundwater level too low for roots to reach the water	Habitats are lost when groundwater drops too deep or too fast.
